$$

## Topics Discussed

- Context \& Definition Loyalty program (LP)
- Empirical evidence about LP efficiency
- Conceptual Framework about Efficiency of Loyalty Progra
- $1^{\text {st }}$ Investigation and data
- Results about Efficiency of Loyalty Programs
- Conceptual Framework about how to improve Loyalty P
- $2^{\text {nd }}$ investigation and data
- Results about how to improve Loyalty Programs

## Loyalty Program (LP)

- Integrated CRM system of individualized marketing actions that aims at:
$\square$ increasing customers' attitudinal \& behavioral loyalty through rewards \& personalized relationships.
- Many American \&European grocery retailers established LP's
$\square$ Since creation AAdvantage in 1981, every sector is concerned (Retailing, Airlines, Car rental, Hotels, ....)
$\square$ In France every grocery has one $\rightarrow$ imitation, less innovation
- More than $90 \%$ of European consumers belonged to at least one loyalty program in 2010 (+11\% growth rate/year ACNielsen 2010).
- Based on the believe that $20 \%$ of store's clients realize $75 \%$ of its turnover (Reichheld 1996)

## Number of loyalty cards in France

| Sector | Program | N. <br> (2009) | cards |
| :---: | :---: | :---: | :---: |
| Grocery Retailing | Casino S'Miles Carrefour Leclerc |  |  |
| Specialised Retailing | FNAC <br> KIABI <br> Douglas Perfumery (Ger) <br> Payback (Germany) <br> Ikea (Germany) <br> But <br> Intersport | 12 Mio <br> 2 Mio <br> 9 Mio <br> 30 Mio <br> 5 Mio <br> 1 Mio <br> 0.5 Mio |  |
| Transport\& Hotel | Air France-KLM (world) American Airlines (wolrd) Lufthansa (Germany) | 15 Mio <br> 30 Mio <br> 15 Mio |  |

## The challenge of loyal customers

## Mixed empirical evidence about LP's efficiency

- LP's positively influence customers' choice of company, transaction values, resistance to counter-arguments, and retention (Nako (1997), Bolton et al. (2000), Lewis (2004), Taylor and Neslin (2005).
- Reward systems prevalent today are expensive to establish and weak changes in customers' purchase behavior do not justify such expenditures (Sharp and Sharp (1997), Reinartz (1999), Mägi (2003), Lewis 2007, Liu (2007), Leenheer et al. (2007)

## Ambiguous results derive from limitations that hinder proper assessments of the effects of loyalty programs.

- None of these investigations had access to loyalty program enrollment dates
- Some studies only compare the impact on the short term (maximum: 1 year)

## Conceptual Framework, Drivers of LP Effectiveness \& Hypotheses

```
If program provides an adequate level of utilities (e.g., rewards, promotions, points) \&lower costs (e.g. subscription fees, switching costs).
```

## Methodology - The sample

- Match of BehaviorScan single source panel data (7 stores, covering 95\% FMCG sales) with grocery retailer Casino (S1) store data (Angers, France): ( 2.500 consumers, 1 Mio. purchasing acts over 3 years).
- 546 S1 loyalty program members over a 156-week period (week 2/1998 - week 2/2001); 266 adoptors during 19982001.
- Use of individual weekly data to test the effect of the following behavioral variables: e.g. frequency of purchase, share-of-wallet (SOW), total \& mean basket in the store, interpurchase time, consecutive store switchings, N of stores visited.
- 6/7 stores offer the same type of LP (cumulated points are exchanged against gifts)

## Store description

| Store | S1 | S2 | S3 | S4 | S5 | S6 | S7 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Surface (m2) | 8,900 | 5,300 | 9,000 | 9,400 | 5,200 | 2,000 | 1,400 |
| Loyalty program | Yes | Yes | Yes | Yes | - | Yes |  |
| Launch loyalty program | 1994 | 1994 | 1995 | 1995 |  | 1996 |  |
| External partners program | Yes | Yes | No | No | - | No |  |
| Loyalty cardholders | 546 | 301 | 744 | 264 | - | 383 |  |
| Loyalty program penetration | $19 \%$ | $11 \%$ | $30 \%$ | $10 \%$ | - | $16 \%$ |  |
| Market share | $20 \%$ | $12 \%$ | $40 \%$ | $11 \%$ | $11 \%$ | $6 \%$ |  |

## Methodology

- Adoption carte: Survival Analysis (Cox 1972): 266 adoptors 1998-01 \& 1.884 S1 buyers who had not adopted by the end of the observation period.
$\square$ Mean, total basket, SOW in S1; n consecutive switches to competitors' stores; n visited stores; n loyalty program memberships; distance S1 ( number of km between the household and S1 and measured from the centroid of the store's zip code to the centroid of the household's zip code)
$\square$ Risk function $h(t)$ : probability event adoption card $h(t)=f(t) / 1-F(t)=f(t) / S(t)$.
$\square h(t)=h_{0} e^{b 1 \times 1+b 2 \times 2+\ldots b n \times n}$
$\square$ If $h(t)$ high probability event adoption card is important $\rightarrow$ positif coefficients of the covariables $b$ increase adoption probability
- Behavior change: MANOVA with repeated measures 3 trimesters (12 months) before and 4 trimesters (15 months) after enrollment; 266 adoptors 1998-01 who lived in S1's primary trading area (households less than 4 km from S1 \& 930 S1 buyers who lived in the same area
- Dirichlet Model:store penetration \& purchase frequency (category and brand)

## Self-selection effect

|  | b | SE | Wald |
| :--- | :---: | :---: | :---: |

| Inter Purch. Time | 12 | 21 | $* *$ |
| Switching | $53 \%$ | $78 \%$ | $* *$ |
| N visited stores | 2,3 | 2,3 | ns |
| Mean Basket Category | 54 | 48 | $*$ |

## A massif card distribution leads to deficits

> Selective distribution (consumers whose behaviours are likely to be modified by the use of the card)

## No impact on market shares

## Market leaders perform better than challengers Double Jeopardy

- Double jeopardy (Ehrenberg 1988): small market share stores suffer because of two threats:
- low share stores are visited by fewer customers than high share stores
- among those who buy in the store, they visit it less often

# Polygamous loyalty is the rule: no impact on Sole Buyers 

No Card Holder
Card Holder

## SOW, Store Switching

## Discussion \& empirical generalizations

- Short- run effects of the loyalty program $\rightarrow$ Support of previous research: Loyalty programs induce only weak, short term effects on purchase behavior after buyers join loyalty programs (Benavent et al. 2000; Leenheer et al. 2007; Mägi 2003; Meyer-Waarden 2002, 2007; Sharp \& Sharp 1997; Meyer-Waarden \& Benavent 2008).
- Most visible change occurred in first weeks after customers joined program, through short-term point pressure mechanism (Taylor \& Neslin, 2005). Small changes drop back to baseline some weeks after enrollment. Customers switch to competitors with greater promotional activity (i.e., points pressure effect) and a retailer simply "borrows" any additional sales from competitors as switching costs are low (Hartmann \& Viard 2008).
- As customers do not receive sufficient rewards for loyalty (i.e., utilities are higher than costs; use of promotional devices ) $\rightarrow$ no rewarded behavior effect appears and customers' repeat buying do not persist
$\square$ No long-term behavioral reinforcement of behavioral learning (Rothschild \&Gaidis 1981)
$\square$ Creation program rather than store loyalty (Nunes \& Drèze 2006)

# What do customers and loyalty program managers think ? 

Investigations:
> 3.000 French customers in all sectors
(2007)
$>30$ LP managers in all sectors (2007)

## Effectiveness LP topic of debate

- High costs program management:
$\square$ Estimated loyalty program expenditures grocery retailers > 100 Mio €/year
- Available customer data is proliferating for better customer segmentation \& targeting $\rightarrow$ improved satisfaction \& loyalty (H 2. Effectiveness Profits)
$\square 14$ \% of retailers "always" use customer loyalty data (A.C. Nielsen 2005; Meyer-Waarden 2007)
$\square 46 \%$ LP managers consider their LP's as efficient (Meyer-Waarden 2007): weak added value, weak differenciation, weak usage of data
- Isomorphism (Powell \& Di Maggio 1982) destroyed differentiation (Meyer-Waarden \& Benavent, 2006).

## Customers low perceived program value (Meyer-Waarden 2007; Sample: 3000 customers)

- 66\% satisfied with monetary value (economies),
- $31 \%$ satisfied with functional value (make purchases easier \& quicker),
- $40 \%$ satisfied with informational value (discovery new products, good deals etc.),
- $31 \%$ satisfied with hedonist value (pleasure),
- 30\% valeur with relational value (establish relationship with brand, treatment as a privileged client, personalization).
- Only transport \& car rental programs grant functionnal services, information \&hédonism

## Reward Structure

|  | Car <br> Rental | Airline | Telephone | Grocery <br> Retailing | Petrol <br> Station | Hotel | Book Store | Perfumery |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Discrepancy between expectations \& perceptions

Relation
Personnalisation
Hedonism
Economy
Fonctionalism

5: maximal score, 1 minimal score
Difference scores perceived value \& expectation : positif $\boldsymbol{\rightarrow}$ satisfaction, negatif $\boldsymbol{\rightarrow}$ dissatisfaction

## The best means to acheive good deals,...

## H2 Effectiveness Profits (Better value proposition through learning \& customisation)

## Conceptual Framework, Drivers of LP Effectiveness \& Hypotheses

```
If program provides an adequate level of utilities (e.g., rewards, promotions, points) \&lower costs (e.g. subscription fees, switching costs).
```

## Purchase Orientations

- Consumers' mental predispositions toward purchase targets, based on experiences $\rightarrow$ explain motivations, preferences \& behaviors (Stone 1954; Kahn \& Schmittlein 1989)
$\square$ Economic: save money;
$\square$ Functional time optimising : save time;
$\square$ Hedonist: discover new products or promotions, have pleasure;
$\square$ Relational: meet people or sales staff;
$\square$ Habit-Loyal Uncertainty avoiding : remain loyal to favorite brands/stores \& gain reassurance about choices in order to mimimise uncertainty
- These targets result in different purchase behaviours \& sensitivity to marketing actions $\rightarrow$ link between purchase orientations \& behaviour.
$\square$ Shopping lists, research \& comparison information (Use of Internet, brochures) vs. impulsive shopping,
$\square$ Research variety vs. Brand Loyalty
$\square$ Usage coupons, promotions \& loyalty schemes
$\square$ Research of relationships, privileges, contact with sales staff.
$\square$ Use of priority check out or home delivery

## Self-Determination motivaton theory (Deci 1971)

- Describes 2 main categories of motivations that explain differentiated behaviours
$\square$ Intrinsic : people engage in activity for its own sake, without external incentive. Intrinsic rewards motivate individuals to act to obtain a benefit that matches their goals $\rightarrow$ positive influence motivation \& behavior on the long term.
$\square$ Extrinsic : extrinsic incentives motivate customers to act to obtain a benefit that sits apart from their target $\rightarrow$ zero or negative influence motivation \& behavior (obtain a reward, avoid to feel guilty, approbation family) on the long term (only short term).
- Heterogeneous motivations depend on individual, contextual characteristics or purchase orientations.

## Conceptual Model - LP usage is goal orientated \& depends on purchase orientations

```
(Ex)intrinsic Motivation according
to purchasing orientations
-economical
- social-relational
- functional
```

```
-informational -uncertainty reducing
- hedonist
```

Loyalty program rewards
economical
social-relational
functional
informational
hedonist

> But: Disparities benefit perception \& motivation due to interpersonal heterogeneity (social origins, buying powers, motivations, purchase targets \& cultures $\boldsymbol{\rightarrow}$ Customers differently motivated by various rewards.

## Methodology-Data

- 2003-2007 in store/airport customer surveys :
$\square 2$ French grocery retailing chains ( $\mathrm{N}=3.132$ ) ,
$\square 1$ international airline ( $\mathrm{N}=1.300$ ),
$\square 1$ international perfumery chain ( $\mathrm{N}=1.214$ ).

| Programme | Hedonism | Relation | Economy | Functional | Information |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Grocery <br> Retailing | Games, <br> sweepstakes, <br> Exchange points <br> against Spa | Personalisation at <br> check-out, <br>  <br> special events | Purchase vouchers, <br> direct reductions at <br> check-out (ratio value <br> reward/spent money : <br> $3 \%$ | Priority check-out, <br> home delivery | Newsletter, <br> personalised <br> Mailings according <br> to most bought <br> products or <br> categories |
| Airline | Games, <br> sweepstakes, <br> Exchange points <br> against airline <br> tickets, hotels |  <br> privileges on board <br> for very good <br> passengers, <br>  <br> special events | Tickets. <br> ratio value <br> reward/spent money : <br> $4.5 \%$ | Priority check-in, <br> access lounges, <br> Quota tickets <br> available at the last <br> moment | Newsletter, <br> Mailings about <br> news |
| Specialised <br> Retailing | Games, <br> sweepstakes, <br> Exchange points <br> against cosmetics, <br> beauty services |  <br> special events | Purchase vouchers, <br> direct reductions at <br> check-out (ratio value <br> reward/spent money: <br> $3 \%$ | Service retouche | Newsletter, <br> Mailings about <br>  <br> personalised <br> beauty advice |

## Methodology-Data

■ Scales: 5 points Likert scales (1 "do not agree at all" - 5 " completely agree")
$\square$ Factor Analysis (Varimax), Confirmatory Factor Analysis \& Structural Equation Modeling (AMOS)
$\square$ Cronbach alphas $>0.7 \rightarrow$ good reliability

- 20 items Purchase orientations ( Laaksonen 1993): 74\% variance
- 15 Items Frequent flier program's rewards perceived value (Chandon et al., 2000): 73\% variance
- 6 Items Impact LP on purchase behavior \& loyalty (Bruner et al 2005): 75\% variance
$\square$ Discriminant \& convergent validity good for all scales.

## Methodology - Estimation (1)

1. Estimation a base model (without purchase orientations or restrictions)
2. Estimation by taking different purchase orientations into account, fit by sector for the validation sample.
3. Estimation extended model to fit the holdout sample.

## Methodology- Estimation (2)

- In all sectors \&both extended models, indexes of adjustment are better than those for the base model.
- The GFI and AGFI >.9, RMSEA <.05., Chi 2 (CMIN) decreases from the base model to the extended models, indicating a better fit of the more complex models that include purchase orientations.
- A Chi 2 difference test reveals no difference (CMIN, p>.1) between the validation and holdout samples; thus, the model displays measurement invariance.

## Impact reward according to purchase orientations (grocery retailing)

> Hypothesized relationships: rewards $\rightarrow$ gratification corresponding to intrinsic purchase orientation $\rightarrow$ PI/RCP.

## Discussion \& theory building

- Customers develop different, coherent purchase behaviors (including loyalty program usage), because they are not intrinsically motivated by same targets.
- Customers' have different intrinsic or extrinsic purchasing orientations determine perceived benefits of loyalty program's reward gratifications \& reinforce differently behaviors.
$\square$ Intrinsic gratifications: motivate customers to act to obtain benefit that falls within target of purchase orientation and thus creates interest or pleasure in the task $\rightarrow$ positive intrinsic reinforcements, long-term impact on purchase behavior.
$\square$ Extrinsic gratifications: motivate customers to act to obtain benefit that is separate from target of purchase orientation $\rightarrow$ no influence or only in the short term
- Challenge behaviorist belief applied in development of most loyalty programs.
$\square$ Money \& promotions to motivate people (conditioned behavior; Skinner 1976).
- Extrinsic rewards "buy" customers' intrinsic motivations to repurchase \& encourage clients to focus narrowly on reward. Therefore, it erodes intrinsic interests and undermine feelings of control, which can interfere with consumers' motivations.

## Managerial Implications

- Strong customer heterogeneity \& absence of segmentation in existing loyalty schemes causes inefficiency
- Principal role of loyalty programs : identify \& segment customers to improve resource allocations.
- Segmentation according to consumers' purchase orientations.
$\square$ Thorough analysis of loyalty schemes' effects, at individual level, because consumer characteristics (e.g., shopping orientations) influence strength and direction of their impact on loyalty.
$\square$ With such information, firms can undertake tailored strategies \& incentives (e.g., promotions, rewards, communication, price discrimination) to appeal to different segments and retain their patronage.

## Limitations \& further research (1 ${ }^{\text {st }}$ investigation)

- The effectiveness of loyalty programs likely depends on the product category or sector. Our results are specific to retail grocers and probably cannot be generalized to other sectors (e.g., baby products, airlines, clothing).
- Convex reward systems \& multitier programs might be more efficient in such contexts (Nunes \& Dreze 2006).
- Further research in other areas should test how these and other factors influence program effectiveness, though such efforts might be difficult in industries that lack marketwide scanner-panel data on competitive purchasing.

## Limitations \& further research (2 $2^{\text {nd }}$ investigation)

- Over-simplification classification purchasing motivations \& rewards:
$\square$ Difficulty to classify rewards exactly \& uniquely to one category of gratification, because they might satisfy several purchase targets at the same time.
$\square$ Exact hypotheses about intrinsic/extrinsic nature of a reward are difficult to formulate as purchase orientations are multidimensional and not hermetical $\rightarrow$ segment overlaps (i.e., hedonist-relational, hedonist-economical).
- Theory intrinsic motivation has been established for creative tasks. Thus the more an activity is complex, the more negative the impact of extrinsic rewards is. Intrinsic interest declines when rewarding somebody by extrinsic rewards (studies in pedagogies seem to confirm this hypothesis)
- Behaviorism still works in restrictive contexts for uninteresting, unpleasant tasks, as grocery shoppping (McGraw \& McCullers 1979)

## Loyalty Programs: Shackle or Reward <br> 

- Grocery loyalty programs as they exist today fall short in terms of creating loyalty
- Loyalty programs focusing on incentives, deals, and promotions are often a very costly proposition for the firm
- "LPs that are most likely to provide sustainable competitive advantage are those that leverage data obtained from consumers into more effective marketing decisions and thus result in true value creation for customers. Loyalty is likely to follow"

## Thank you for your attention

Vector autoregressive (VAR) persistence modeling to test the long term effects of marketing actions - The case of a loyalty program

## Methodology - The sample

- Match of BehaviorScan single source panel data with grocery retailer store data (Angers, France)
- 546 loyalty program members over a 156-week period (week 2/1999-week 2/2002)
- Use of weekly data to test the effect of the following behavioral variables: e.g. frequency of purchase, share-of-wallet (SOW), mean basket in the store
- To integrate the effect of the loyalty program, we considered the number of new loyalty cards distributed, which regularly increased over time.

# Methodology - Persistence modeling to model long term impact of LP's (Dekimpe \& Hanssens 1995) 

$\square$ Unit-root tests: to investigate presence of evolution vs stability for purchasing behavior indicators
$\square$ VAR (Vector Auto Regressive) models, causality tests \& Impulse response functions: To assess potential long-term impact of $N$ loyalty cards distributed at each period and Proportion of loyalty cards used during future periods on behavioral variables (i.e. SOW, frequency of purchase, mean basket)
$\square$ VAR model estimation: JMulti [http://www.jmulti.de] (Lütkepohl \& Krätzig 2008)

## 1. Unit Root Tests

- Rejection of unit-root null hypothesis as data is stationary (as overwhelming majority of demand patterns; Dekimpe et al. 2001).
- The loyalty indicators fluctuate around a fixed mean level
$\square \rightarrow$ no long-run evolving effects in data
$\square \rightarrow$ impact of past shocks is temporary, diminishes \& loyalty indicators return to their preshock mean levels (i.e., stability).

But problem of unit-root tests:

- Indicate only potential for long-run marketing effectiveness
- Behavioral variables \& LP membership are endogenous (i.e., explained by own past level \& past levels of other endogenous variables).

## 2. VAR models to trace over-time impact of unexpected shock movements (1)

To assess potential I/t impact of marketing actions (i.e. LP)

- Estimation vector-autoregressive (VAR) model that captures evolution \& interdependencies of multiple time series ("SOW, Frequency of purchase, Mean basket, N of loyalty cards distributed at each period, Proportion of loyalty cards used during future periods").
- VAR models measure direct (immediate \& lagged) responses to marketing actions and capture performance implications of complex feedback loops.

## 2. VAR models to trace over-time impact of unexpected shock movements (2)

- VAR models estimate baseline of each endogenous variable \& forecast future values according to dynamic interactions of all jointly endogenous variables.
- Criteria for optimal number of lags :
$\square$ Akaike information,
$\square$ Hannan-Quinn,
$\square$ Schwarz criteria,
$\square$ Final prediction error.

## 2. VAR models (3) -Causality tests

| Variable | Causal Hypothesis | Granger <br> Causality | $\mathbf{p}$ | Instantaneous <br> causality | $\mathbf{p}$ |
| :---: | :--- | :---: | :---: | :---: | :---: |
|  | New cards-> Behavior | 0.908 | 0.489 | 1.706 | 0.426 |
|  | Prop. Buyer with Cards-> Behavior | 3.149 | 0.005 | 16.392 | 0.000 |
| Mean Basket | New cards-> Behavior | 0.415 | 0.660 | 1.833 | 0.400 |
|  | Prop. Buyer with Cards-> Behavior | 2.709 | 0.05 | 13.370 | 0.001 |
| SOW | New cards-> Behavior | 17.916 | 0.00 | 1.349 | 0.05 |
|  | Prop. Buyer with Cards-> Behavior | 0.972 | 0.03 | 50.246 | 0.000 |

- The VAR causality tests indicate that we:
- Do not reject the assumption of noncausality $(p>0.05) \rightarrow$ " $N$ new loyalty cards distributed" never influences purch. behavior (exception SOW, $p<0.05$ ).
- Reject the assumption of noncausality for purchasers who have a loyalty card ( $p<0.05$ ) $\rightarrow$ effect of self-selection. LP members are heavier customers who make a stronger contribution than do nonmembers, so when N cardholders increases, the behavioral loyalty indicators also increase with respect to demographics. This causality is ecological.

## 2. VAR forecast error variance decomposition (1)

- The tests imply that we might eliminate the $N$ of new cards distributed from the VAR models (However, use of the variable as an exploratory target to obtain impulse response functions and to examine their shapes.
- We calculated VAR forecast error variance decomposition for purchase frequency, SOW, and mean basket, as well as the impact of the introduction of the loyalty card on the same purchasing behavior variables.

## 2. VAR forecast error variance decomposition (2)

|  |  | Proportion <br> exist. loyalty <br> cardholders | Behavior | Mean | Std dev. | Unitary <br> effect <br> (UE) | UE <br> /Mean |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| N New cards | Suying frequency S1 | 0.00 | 0.24 | 0.76 | 26.059 | 6.913 | 0.160 |
| Mean Basket S1 | 0.00 | 0.14 | 0.86 | 393.908 | 29.867 | 1.187 | $0.30 \%$ |
| SOW S1 | 0.01 | 0.45 | 0.54 | 0.171 | 0.015 | 0.002 | $1.40 \%$ |

- " N new loyalty cards" has a very weak direct effect on behavioral indicators $\rightarrow$ in line with results from causality tests.
- However: "Proportion of existing loyalty program members" represents substantial share of variance, particularly for SOW.

## 3. Impulse response functions

- If systematic tests of instantaneous causality \& Granger tests are satisfactory, calculation:
$\square$ baseline for endogenous variables
$\square$ impulse response functions for unexpected shocks due to marketing variables ("SOW, Frequency of purchase, Mean basket, N of loyalty cards distributed at each period, Proportion of loyalty cards used during future periods")

## Impulse response functions

- Demand effects from " N of new cards distributed" on "Attraction of new customers to store, current customers' increased purchases" are only weak (1\%)
- Effects are not persistent \& disappear quickly, after 3 weeks at most.
- In 95\%: strongest increase 1.4\% \& weakest is $0.3 \%$.

## Mean Basket

- Mean baskets increase at most by $0.8 \%$.

## SOW

- Impact is highest during 2 nd week \& increases by $1.4 \%$.

## Purchase Frequency

- Purchase frequency increases at most by $0.2 \%$.

## Modèle de survie

- variable aléatoire positive $T=$ durée d'adoption
- fonction de densité $\boldsymbol{f}(\boldsymbol{t})=\lim [\operatorname{Pr}(t<T<t+d t)])=$ densité de probabilité de subir l'événement de prendre carte de fidélité à un instant $t$.
- fonction de survie $S(t)=\operatorname{Pr}(T \geq t)=1-F(t)=1-\operatorname{Pr}(T<t)=$ probabilité cumulée de survie dans le temps de ne pas avoir encore avoir adopté le programme.
- fonction de risque $\boldsymbol{h}(\boldsymbol{t})=\operatorname{Pr}(t \leq T \leq t+d t / T \geq t-1))=$ probabilité conditionnelle que l'événement « adoption de la carte » apparaisse à instant donné sachant qu'il n'est pas encore survenu. $h(t)=f(t) / 1-F(t)=$ $f(t) / S(t)$. Si $h(t)$ est élevé le risque d'adhésion est important.
- Pas de spécification fonction de risque paramétrique, suppose que risques sont proportionnels.
- $h(t)=h_{0} e^{b 1 \times 1+b 2 \times 2+\ldots}$ bn xn
- coefficients positifs covariables $B$ diminuent probabilité de survie\& augmentent probabilité d'adoption, coefficients négatifs diminuent cette dernière.

## Intensity before/after subscription

No statistical significant impact on purchase intensity.
